### GUIDELINES FOR ORDERING WETSUITS & DRYSUITS

- Height to be in inches.
- Weight to be in pounds.
- All measurements to be taken with a soft measuring tape snug but not tight.
- The person being measured should be standing erect and in a relaxed condition. This is especially important for measurements #11, #12.
- If the order is for a drysuit, please indicate what the person will be wearing under the suit. Eg., Underseals, track pants, etc.
- Please make sure you have indicated valve placement, what side the nipple of the intake valve should point to, all options (eg. pockets, heavy duty knee pads, relief zipper, etc.), where the options should be located, colour of suit and style of model.

### GUIDE TO TAKING MEASUREMENTS

#### Measurement Number:

- #4** Follow the contour of the chin from the lower lip, under the chin down the neck to the collar bone.
- #6** From the mid-point of the shoulder slope measure down the side of the body (not over the chest) to the waist level as determined in measurement #16.
- #7** Measure from the waist (as determined in measurement #16) to the middle of the kneecap.
- #8** Measure from the middle of the kneecap to the anklebone
- #10** Measure as per above but to the hip bone instead of the waist.
- #11** This is a very critical measurement. Measure as per above with the tape hanging vertically from the shoulder. Place a book between the legs at the crotch level and sight a line from the top of the book across to the measurement tape. Note: Always keep the tape vertical, do not bring it across the body to the crotch.
- #12** Measure from the crotch (as determined in measurement #11) to the middle of the ankle bone.
- #13** This is a very critical measurement. Measure from the crotch (as determined in measurement #11) to the floor. Note: The subject must be in bare feet.
- #14** Measure from the middle of the shoulder over the armpit and down the side to the anklebone. Tape does not have to follow the contours of the body.
- #15** Measure around the chest at nipple height with arms at the sides. Note: ensure the subject does not take a deep breath while being measured.
- #16** Measure at the narrowest point, not at belly-button level.
- #17** Measure around the heaviest part of the buttocks.
- #18** Measure around the thigh at the crotch level.
- #19** Measure halfway between the crotch and the middle of the kneecap.
- #23** Measure across the back from shoulder joint to shoulder joint. Note: The shoulder joint can be found by moving the arm up and down and then locating the connecting point to the shoulder or by using the protruding bone at the end of the shoulder bone.
- #24** Measure from the wrist joint to the shoulder joint. Locate the shoulder joint as per measurement #23.
- #25** The measuring tape should be pulled tight around the armpit and shoulder and then relaxed to a snug fit.
- #31** The arm should be held out from the body at 90 degrees, then bent forward approximately 15 degrees.

Note: Brooks Wetsuits Ltd. will endeavour to clarify any suspect measurements, but ultimately the responsibility for accurate measurements lies with the person doing the measuring. If you have any inquiries, please contact Brooks Wetsuits Ltd.
